        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                          Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein search, using sw model

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC (TJ). The peptide antagonists are based on a common motif of ZOT CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC and yet does not physiologically modulate the opening of TJ in the CC increased intestinal permeability and the peptide is useful for CC increased intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite CC infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations, e.g. gastricts, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases marked by Imphatic obstruction, e.g. congenital intestinal lymphangiectasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC coretiac disease, eosinophilic gastroenterits; parasite protein congenital heart disease with Fontan's operation, concentrations of congenital heart disease, disease, miseases, consease, disease, according to the content of congenital heart disease with Fontan's operation, concentrations of congenital heart disease, disease, according to the content of congenital heart disease with Fontan's operation, and immune diseases, according to the content of congenital heart of fond allerties and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                celiac disease; Sjogren's syndrome; systemic lupus erythematosus; auto-immune thyroiditis; idiopathic thrombocytopenic purpura;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The method can be used to down-regulate APC-mediated lymphocyte proliferation in mammalian hosts suffering from auto-immune or immune-related disorders, immune system rejection subsequent to tissue or organ transplantation, or inflammatory or allergic diseases. The autoimmune or immune related disorders include multiple sclerosis, rheumatoid arthritis, insulin dependent diabetes mellitus, celiac disease, Sjogren's syndrome, systemic lupus erythematosus, auto-immune thyroiditis, idiopathic thrombocytopenic purpura, hemolytic anemia, Grave's disease, Addison disease, autoimmune orchitis, pernicious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            suppressing antigen presenting cell (APC) mediated 2, mediated antigen proliferation in a mammalian host pre-exposed to a particular antigen. Proliferation in a mammalian host pre-exposed to a particular antigen. The method comprises administering to the host an effective amount of a Zot-related immunoregulator selected from Zot (zonula occludens toxin) of zonulin, the amount effective to down-regulate the activity of the APC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowers intestance in the state obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (TJ). The peptide antagonists are based on a common motif of 20T and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis

The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Yibrio cholerae zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain
                                                                                                    Immunoglobulin variable domain; primer; polymerase chain reaction; chimeric antibody; human milk fat globule; BrE-3 VL-chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primers JO2, JO3, JO4, JO14 and VH1BACK (Q62740-Q62744) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. The amino acid sequences deduced from the amplified VL and VH regions were compared to V-terminal sequences which had been determined directly (i.e. R52774 and R52775). The general agreement between the predicted and the determined amino acid sequences that the cloned cDNAs encode BrE-3
                                                                        New analogue peptide(s) comprising used to develop prods. for use in therapy and prevention of neoplasms
                                                                                                                                                                                                                                                                                                                                                                                                                        16-NOV-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       primers JO2, JO3, JO4, JO14 and VH1BACK (Q62765-Q62769) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. The amino acid sequences deduced from the amplified VL and VH regions were compared to N-terminal sequences which had been determined directly (i.e. R52792 and R52793). The general agreement between the predicted and the
B07556-78 represent proteins encoded by open reading frames (UKFS) 8 to 30 of the BLM (Bleomycin) gene cluster. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce also useful for chemically modifying amino acids and fatty

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ħ
This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

This represents a human immunoglobulin G (IgG) derived peptide sequence that has a stimulating effect on the fibrinolytic activity of the scuPA/suPAR complex of the invention. This sequence has similarity to the human IG heavy chain, IG V-III region (HV3T). The invention provides a thrombolytic therapeutic composition for the treatment and prevention of
                                                                                                                                                          New compositions with thrombolytic activity for, e.g. treatment of thromboembolism - comprise complex of single chain urokinase type plasminogen activator, scuPA, and soluble urokinase plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombolytic activity; soluble urokinase plasminogen activator receptor; single chain urokinase type plasminogen activator; thromboembolism; scupA; supAR; IgG; regulator; fibrinolytic activity; fibrin clot; myocardial infraction; cerebro-vascular event; pulmonary embolism;

The composition comprises, as the active ingredient, a complex of a single chain urokinase type plasminogen activator (scuPA) and a soluble urokinase plasminogen activator receptor (suPAR). The complex (scuPA/suPAR) has thrombolytic activity under physiological conditions and in the presence of IgG, or of at least 1 IgG-derived peptide, and induces fibrinolysis of fibrin clots. The compositions and complex are useful for the treatment or prevention of thromboembolic disorders associated with the formation of fibrin clots, especially myocardial infractions, cerebro-vascular events, pulmonary embolism and deep vein thrombosis.
                                           Suppression of antigen presenting cell mediated lymphocyte proliferation, by administering a Zot-related immunoregulator of treating immune-related disorders, immune system rejection subsequent to tissue or organ transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences encoded by novel isolated genes. The genes (Q78939-79002) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR amplification using primers Q78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TaqI restriction enzyme. The fragments were separated by gel elecrophoresis and 35-45 kb fractions were collected. The fragments were ligated with ClaI-digested cosmid vector pJB81. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The Vh genes and immunoglobulin in mammalian hosts.
The amino acid sequence (W00240) of (VH) of the epidermal growth factor

human chimeric antibody chMint5 was deduced from a cDNA clone (T33445) obtd. by PCR amplification of murine Mint5 hybridoma DSM ACC2150 cDNA. chMint5 comprises Mint5 VH and VI regions fused to human C-gammal and CK regions. Constructs were expressed in CHO cell transfectants. chMint5 shows lower immunogenicity than

CHO cell transfectants. chmint5 shows lower immunogenicity than Mint5 when administered to humans. It can be used in diagnostic assays or used to produce immunotoxins or immunocytokines useful

```
C97991 to C98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in B53234 to B54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins

                                A B-cell superantigen (sAg) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The sAg is used to enhance production of VH, especially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (R54802-16, 064842-56) of VH regions of SpA binders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

J. Biol. Chem. 254:11418-11430(1979).
-!- MISCELLANEOUS: THIS ALPHA CHAIN WAS ISOLATED FROM A MYELOMA PROTEIN THAT CONTAINS ONE LIGHT AND ONE HEAVY CHAIN PER MOLECULE, LINKED BY A DISCULFIDE BOND. IN CONTRAST, NORMAL MOUSE IGA MOLECULES CONTAIN TWO LIGHT AND TWO HEAVY CHAINS AND LACK A LIGHT-HEAVY CHAIN DISCULFIDE BOND.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
